# 2014 WeatherSeal Change

## WEATHERSEAL

Even WeatherSeal can't stay the same forever. Because of a change in a single component in WeatherSeal's formula, it will not be as Super Thick as your previous customers are used to. It is still very thick and unique in its thickness, but when compared to our former Super Thick version of WeatherSeal, your customers will notice a difference. However, the core ingredients, the volume solids, the essential components that enable WeatherSeal to perform so well, have not changed whatsoever.

## ENVIRONMENTAL

This transition took place back in July 2014. This change occurred because the replacement ingredient provides a cleaner environmental profile for WeatherSeal. We are always continually looking to make improvements with all our coatings in both the area of weather performance and the environment and in this instance the change occurred because of environmental considerations.

## IMPORTANT THINGS TO NOTE

- **CAN BE INTERMIXED:** Our new thinner version and the older thicker version can be intermixed.
- **COLOR CONFUSION:** An open container of the thicker version when visually compared to an open container of our revised thinner version of the same color will appear quite different. The color difference is an optical one created by their differing thicknesses.

## DON'T BE FOOLED BY APPEARANCES!
